

Plasma Pulsed Arc

Introduction

Thermal plasmas have nowadays a large range of industrial applications including cutting, welding, spraying, waste destruction, and surface treatment. Thermal plasmas are assumed to be under partial to complete local thermodynamic equilibrium (LTE) conditions. Under LTE, the plasma can be considered a conductive fluid mixture and therefore, be modeled using the magnetohydrodynamics (MHD) equations. This model shows how to use the Equilibrium Discharges, In-Plane Currents interface (available in 2D and 2D axisymmetric) interface to simulate the plasma generated in a pulsed arc.

Note: This application requires the Plasma Module and AC/DC Module.

Model Definition

This model is based on the work presented in Ref. 1. In Ref. 1 The authors develop a complex model that includes the description of the weld pool under the action of a pulsed arc. In this work it is only simulated the plasma and the transfer of heat and currents in the metals neglecting the weld pool. This model starts by opening a model of a DC arc which solution are going to be used as initial conditions to the time-dependent problem.

The applied current consists of a pulse with a frequency of 1 Hz, a peak current of 160 A, a floor current of 80 A, and a duty cycle of 0.5. The current source is set at the cathode and the bottom plate is grounded. In the 5 mm gap between the electrodes an argon plasma arc is created that heats the metal electrodes and surrounding gas. A shielding flow is added along the cathode.

The temperature-dependent physical properties of argon are loaded from the material library under Equilibrium Discharge. The temperature range of the physical properties span from 500 K to 25,000 K. A minimum electric conductivity of 1 S/m is used for numerical stability reasons. Another important aspect to keep in mind is that the model used is not valid to describe the plasma sheath region since in this regions there is charge separation and deviations from equilibrium. From the practical point of view, having a fine resolution in the plasma-electrode region causes numerical instabilities (and does not bring a better description of the physics). To make the model more stable use a mesh coarse enough so that the plasma sheath is averaged out.

Figure 1 and Figure 2 show the fluid velocity and temperature for instants in the current peak and floor of 160 A and 80 A at 5 s. As expected, at the peak value the fluid velocity and temperature are higher. In the results shown the temperature of the subtract still has not reached a steady state that is reached at about 50 s. The final time of computation was set to 5s for practical reasons. The weld pool (not solved here) also has significant changes during the pulse different phases as shown in Ref. 1.

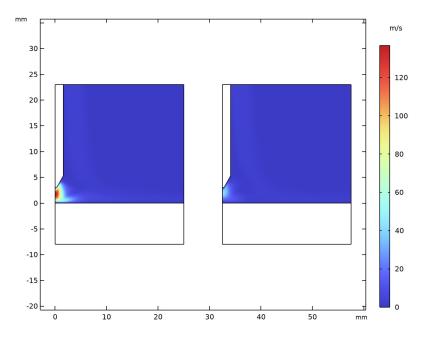

Figure 1: Plot of the velocity magnitude of the fluid at the current peak of 160 A (left) and current floor of 80 A (right).

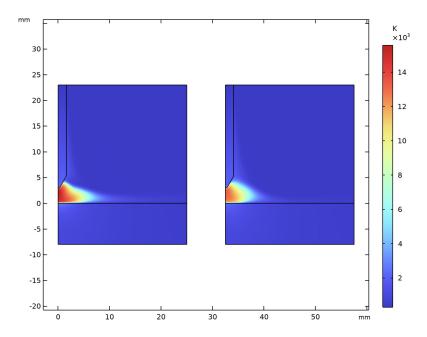

Figure 2: Plot of the plasma temperature at the current peak of 160 A (left) and current floor of 80 A (right).

Modeling Instructions

This model uses an existing model from a DC arc and sets an AC excitation instead. The solution of the DC arc model are used as initial conditions to the time-dependent model.

APPLICATION LIBRARIES

- I From the File menu, choose Application Libraries.
- 2 In the Application Libraries window, select Plasma Module > Equilibrium Discharges > plasma_dc_arc in the tree.
- 3 Click Open.

RESULTS

Temberature 3D

Click the **Zoom Extents** button in the **Graphics** toolbar.

Add a parameter to define the floor of the current pulse.

GLOBAL DEFINITIONS

Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- **3** In the table, enter the following settings:

Name	Expression	Value	Description
delta	80[A]	80 A	

Add a square wave function to define the pulsed excitation.

COMPONENT I (COMPI)

In the Model Builder window, expand the Component I (compl) node.

DEFINITIONS

Waveform I (wvI)

- I In the Model Builder window, expand the Component I (compl) > Definitions node.
- 2 Right-click **Definitions** and choose **Functions** > **Waveform**.
- 3 In the Settings window for Waveform, type current in the Function name text field.
- 4 Locate the Parameters section. From the Type list, choose Square.
- 5 In the Size of transition zone text field, type 0.05.
- **6** In the *T* text field, type 1.
- **7** In the φ text field, type 180.
- **8** In the A text field, type delta/2.

Duplicate the existent Normal Current Density feature and set a pulsed current. The Normal Current Density features are disabled at the study level when needed.

MAGNETIC AND ELECTRIC FIELDS (MEF)

In the Model Builder window, expand the Component I (compl) > Magnetic and Electric Fields (mef) node.

Normal Current Density 2

- I In the Model Builder window, expand the Component I (compl) > Magnetic and Electric Fields (mef) > Magnetic Insulation I node.
- 2 Right-click Component I (compl) > Magnetic and Electric Fields (mef) > Magnetic Insulation I > Normal Current Density I and choose Duplicate.
- 3 In the Settings window for Normal Current Density, locate the Normal Current Density section.
- 4 In the J_n text field, type (IO+delta/2+current(t[1/s]))/(pi*(1.6[mm])^2).

Disable the pulsed excitation for the stationary study. This way, if this study needs to be solved later the correct current feature is used.

STUDY I

Steb 1: Stationary

- I In the Model Builder window, expand the Study I node, then click Step I: Stationary.
- 2 In the Settings window for Stationary, locate the Physics and Variables Selection section.
- 3 Select the Modify model configuration for study step checkbox.
- 4 In the tree, select Component I (compl) > Magnetic and Electric Fields (mef) > Magnetic Insulation I > Normal Current Density 2.
- 5 Click ODisable.

RESULTS

Electric conductivity, Magnetic Flux, Temperature, Temperature 3D, Velocity

- I In the Model Builder window, under Results, Ctrl-click to select Temperature, Velocity, Electric conductivity, Magnetic Flux, and Temperature 3D.
- 2 Right-click and choose Group.

DC Arc

In the Settings window for Group, type DC Arc in the Label text field.

ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies > Time Dependent.
- 4 Click the Add Study button in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

STUDY 2

Steb 1: Time Dependent

Prepare the time-dependent study. Here, a few changes are necessary: disable the DC excitation, use previous solutions as initial conditions, use a fully coupled solver.

- I In the Settings window for Time Dependent, locate the Physics and Variables Selection section.
- 2 Select the Modify model configuration for study step checkbox.
- 3 In the tree, select Component I (compl) > Magnetic and Electric Fields (mef) > Magnetic Insulation I > Normal Current Density I.
- 4 Click Disable.
- 5 Locate the Study Settings section. In the Output times text field, type range (0,0.1,5).
- 6 In the Study toolbar, click $\underset{=0}{\overset{\cup}{}}$ Get Initial Value.

RESULTS

Electric Field (mef), Magnetic Flux Density (mef), Magnetic Flux Density, Revolved Geometry (mef), Pressure (spf), Temperature (ht), Velocity (spf)

- I In the Model Builder window, under Results, Ctrl-click to select Magnetic Flux Density (mef), Magnetic Flux Density, Revolved Geometry (mef), Electric Field (mef), Temperature (ht), Velocity (spf), and Pressure (spf).
- 2 Right-click and choose Group.

Pulsed Arc

In the **Settings** window for **Group**, type Pulsed Arc in the **Label** text field.

2D Plot Group 14

In the **Results** toolbar, click **2D Plot Group**.

Disable the streamline plot for the B field since it only exists in the phi direction.

Streamline 1

- I In the Model Builder window, expand the Magnetic Flux Density (mef) node.
- 2 Right-click Streamline I and choose Disable.

Temperature Pulsed

- I In the Model Builder window, under Results > Pulsed Arc click 2D Plot Group 14.
- 2 In the Settings window for 2D Plot Group, type Temperature Pulsed in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2/Solution 2 (sol2).

Surface I

- I Right-click Temperature Pulsed and choose Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- **3** In the **Expression** text field, type T.
- 4 Locate the Coloring and Style section. From the Color table list, choose Thermal.

STUDY 2

Step 1: Time Dependent

- I In the Model Builder window, under Study 2 click Step 1: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Values of Dependent Variables section.
- 3 Find the Initial values of variables solved for subsection. From the Settings list, choose User controlled.
- 4 From the Method list, choose Solution.
- 5 From the Study list, choose Study I, Stationary.

Solver Configurations

In the Model Builder window, expand the Study 2 > Solver Configurations node.

Solution 2 (sol2)

- I In the Model Builder window, expand the Study 2 > Solver Configurations > Solution 2 (sol2) node.
- 2 Right-click Time-Dependent Solver I and choose Fully Coupled.
- 3 In the Settings window for Fully Coupled, click to expand the Method and Termination
- 4 In the Damping factor text field, type 0.8.

5 From the Jacobian update list, choose Once per time step.

Step 1: Time Dependent

- I In the Model Builder window, under Study 2 click Step 1: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Results While Solving section.
- 3 Select the **Plot** checkbox.
- 4 From the Plot group list, choose Temperature Pulsed.
- 5 From the Update at list, choose Time steps taken by solver.
- 6 In the Study toolbar, click **Compute**.

RESULTS

Magnetic Flux Density (mef)

Prepare plots to show the velocity and the temperature for the peak and floor values of the current side by side.

Velocity (spf)

- I In the Model Builder window, click Velocity (spf).
- 2 In the Settings window for 2D Plot Group, click to expand the Title section.
- **3** From the **Title type** list, choose **None**.
- 4 Click to expand the **Plot Array** section. Select the **Enable** checkbox.

Surface

- I In the Model Builder window, expand the Velocity (spf) node, then click Surface.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Dataset list, choose Study 2/Solution 2 (sol2).
- 4 From the Time (s) list, choose 4.6.
- 5 Locate the Coloring and Style section. From the Color table list, choose RainbowLight.

Surface 2

- I Right-click Surface and choose Duplicate.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Time (s) list, choose 5.
- 4 Click to expand the Inherit Style section. From the Plot list, choose Surface.
- 5 In the Velocity (spf) toolbar, click Plot.
- **6** Click the **Zoom Extents** button in the **Graphics** toolbar.

Velocity (spf)

- I In the Model Builder window, click Velocity (spf).
- 2 In the Settings window for 2D Plot Group, locate the Color Legend section.
- 3 Select the **Show units** checkbox.

Temperature Pulsed

- I In the Model Builder window, click Temperature Pulsed.
- 2 In the Settings window for 2D Plot Group, locate the Title section.
- 3 From the Title type list, choose None.
- **4** Locate the **Color Legend** section. Select the **Show units** checkbox.
- **5** Locate the **Plot Array** section. Select the **Enable** checkbox.

Surface I

- I In the Model Builder window, click Surface I.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Dataset list, choose Study 2/Solution 2 (sol2).
- **4** From the **Time (s)** list, choose **4.6**.
- 5 Locate the Coloring and Style section. From the Color table list, choose RainbowLight.

Surface 2

- I Right-click Results > Pulsed Arc > Temperature Pulsed > Surface I and choose Duplicate.
- 2 In the Settings window for Surface, locate the Data section.
- **3** From the **Time (s)** list, choose **5**.
- 4 Locate the Inherit Style section. From the Plot list, choose Surface 1.
- 5 In the Temperature Pulsed toolbar, click Plot.

Temperature Pulsed

Plot the temporal evolution of the applied current and the temperature of the bottom plate.

Current vs. Time

- I In the Results toolbar, click \sim ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Current vs. Time in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2/Solution 2 (sol2).
- 4 Click to expand the **Title** section. From the **Title type** list, choose **None**.

Point Graph 1

- I Right-click Current vs. Time and choose Point Graph.
- **2** Select Point 4 only.
- 3 In the Settings window for Point Graph, locate the y-Axis Data section.
- 4 In the Expression text field, type -mef.mi1.ncd2.nJ*(pi*(1.6[mm])^2).
- 5 In the Current vs. Time toolbar, click Plot.

Temperature vs. Time

- I In the Results toolbar, click \sim ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Temperature vs. Time in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2/Solution 2 (sol2).
- 4 Locate the Title section. From the Title type list, choose None.

Point Graph 1

- I Right-click Temperature vs. Time and choose Point Graph.
- **2** Select Point 1 only.
- 3 In the Settings window for Point Graph, locate the y-Axis Data section.
- **4** In the **Expression** text field, type T.
- 5 In the Temperature vs. Time toolbar, click **Plot**.
